

Voice Based Concept Understanding Analyser

Topic: MACHINE LEARNING

Reference Definition

Machine Learning (ML) is a subfield of artificial intelligence that enables computer systems to learn from data and improve their performance on a specific task without being explicitly programmed. It involves the development of algorithms that can identify patterns, make predictions, or take decisions based on the data they are trained on. These models continuously adapt and enhance their accuracy over time as they are exposed to new information, allowing them to solve complex problems and automate tasks across various applications.

Student Transcript

Machine Learning is a programming language, developed by Microsoft. It is mainly used to design computer hardware and repair mobile phones. It is also a type of operating system. And the machine learning is related to artificial intelligence it helps computers learn from data and make predictions. It is also used for creating websites and designing mobile applications. Available application machine learning stores, files on cloud servers and is mainly used to create databases.

Semantic Similarity: 77.91%
